Once upon a time, Photoshop was the standard tool for graphic designers. Today, designers use it to hand off their work to web designers, developers and marketing people, with the expectation that their work will be well-commented upon by employees at the final destination. In recent years, as web designers have become interested in creating their own assets and content for their websites, it has become increasingly common to create an entire web design all in Photoshop. This tutorial shows you how to create a minimalist, modern logo from scratch in Photoshop. We'll take you through the entire process from start

to finish - including creating a vector file, applying a gradient, working with smart objects, and adjusting the details. We'll be using all the tools included in the Adobe Creative Cloud, starting with Photoshop, then moving on to Illustrator, After Effects and Premiere Pro. When we're done, you'll have a slick vector logo that's just as easy to adjust as any digital asset you've worked on before. Adobe Photoshop is free to download and has the tools you need to edit photos, create graphics and images, and design websites. Photoshop is not for everyone - unless you're a graphic designer, a web designer, or a photographer who wants to use the software to edit images. But Photoshop is

the undisputed leader in photo-editing software and is used to create millions of professional images every day. A few years ago, Photoshop was the only game in town. Everyone used it - even those who hated it - because it was so robust and feature-rich. But, today, there are plenty of alternatives - many of which run on Mac OSX and are free. Photoshop used to be the only game in town, but now there are a lot of competing products and sub-categories of products. When choosing a graphics editor to edit your photos and create graphics, there are a few important things to consider. Here are the most important questions when choosing a graphics editor: How do I feel

about purchasing a piece of software that costs thousands of dollars? If you need better technical support, Photoshop costs nothing - and Adobe will be there to help you 24/7. Is the workflow easy to use? It's rare that Photoshop is the only tool you need to create an image. Often Photoshop works best in collaboration with an illustration program like Adobe Illustrator, Adobe InDesign, and other programs, and it

Q: Should I use a reference for non-const variables? Basically I have a class that has a lot of non-const member variables. Currently I'm declaring them like this:

```
class MyClass { public: MyClass(); ...  
void SetVariable( const int n ); private: int  
n; ... }
```

And then when I'm doing certain operations on the class I make sure to declare them as const because the compiler still allows them to be modified (and before anyone mentions it, yes, I know that in C++ you shouldn't modify variables). My question is, is this a good way to do it? For instance, I'm passing by

reference to functions that I want to modify them in the function itself. So, would it be better to just declare the variable as const and let the compiler prevent it? A: What you're doing is fine. It is the C++ standard. It is guaranteed by the C++ standard that once you modify a const object via a const reference or pointer, it is not modified by subsequent actions. The only actions which may damage a const object are modification by a reference or pointer to a non-const object. A: It's safe to do. If you want to make sure that no one tries to modify your object accidentally or maliciously, then you should make it const. Otherwise, it's OK. Robbie Bertin Robbie Bertin

Q: How to attach animation to a custom button? I am creating a simple clock. I have a custom button, and I am trying to make it animated by assigning a simple animation to the Button.animation variable. But this just doesn't work.

Here's my code :

```
typealias ButtonType =
UIButton! let btn: ButtonType =
UIButton(frame: CGRectMake(0, 0, 10,
10)) btn.setTitle("12", forState:
UIControlState.Normal)
btn.addTarget(self, action:
"buttonTapped:", forControlEvents:
UIControlEvents.TouchDown)
self.view.addSubview(btn) let animation:
UIAnimation =.Fade(duration: 0.5)
btn.animation = animation
```

EDIT : I just removed the action and the target function. This works fine so far. But I still can't figure out how to make it animate. A: It might be that the typealias itself needs a type hint. Try putting a! on the typealias.

```
btn.addTarget(self, action:
```

UIControlEvents.TouchDown) Q: How
do I set the rows in my google
spreadsheet based on a condition I have a
table of data with 40 rows (30 line total),
20 that have a certain category. I want to
be able to set the row in the table that has
the appropriate category. For example, I
want to change the first row from 10 to
11, second row from 11 to 12, and so on,
until I have the 20 row in the table with
the 20 different category numbers. A:
This can be achieved with an if statement.
Simply make a "table" of how many rows
you need, such as 4 ($30/4 = 7$ rows). Then
apply the following array formula to all
the rows required: =row(column) = 4+1.

Note: the table value has to equal 4 (7/4) for it to work. # test54.d: test for a leaky type (static array of all types, # filled with monotonically increasing integers) # #
